Test 1

PAPER NO.: -

PAGE NO.: 1 of 8

DEPARTMENT & COURSE NO.: MATH 3530

TIME: 90 minutes

EXAMINATION: Mathematical Problems in Biology

EXAMINER: S. Portet

NAME: _____

STUDENT NUMBER: _____ SEAT NUMBER: _____

SIGNATURE: _____

This is a 90 minute exam. Lecture Notes are allowed.

This exam has 6 questions.

PLEASE SHOW YOUR WORK CLEARLY. A correct answer without explanation will not get full marks.

Question	Points	Score
1	15	
2	8

PAGE NO.: 2 of 8

DEPARTMENT & COURSE NO.: MATH 3530

TIME: 90 minutes

EXAMINATION: Mathematical Problems in Biology

EXAMINER: S. Portet

1. (15 points) Consider a species that lives for two years and may reproduce at the end of year one or year two.
 - the mean number of offspring that 0-year olds have the following year is 1
 - the mean number of offspring that 1-year olds have the following year is 4
 - the probability that a 0-year old survives to be a 1-year old is 0.1.
 - (a) Set up the Leslie matrix model.
 - (b) Assume that the initial population consists of ten 0-year olds and six 1-year olds. How many 0-year olds and how many 1-year olds will there be one year later.
 - (c) Find the growth rate and the stable age distribution.

2. (8 points) The dynamics of a particular population (measured in thousand) of birds is described as follows

$$\frac{dP}{dt} = 4P(1 - 8P^3)$$

- (a) Find the equilibria.
- (b) Determine the local stability of each equilibrium.

EXAMINER: S. Portet

3. (8 points) The population (measured in billions) of insects in generation t is described as follows

$$P_{t+1} = P_t e^{4(1-3P_t)}$$

- (a) Find all equilibria.
- (b) Determine the local stability of each equilibrium.

EXAMINER: S. Portet

4. (8 points) Consider the difference equation that represents the size of a population in generation $t + 1$

$$x_{t+1} = f(x_t),$$

its graph is shown in the Figure below

- (a) Find all equilibria.
(b) Determine the local stability of each equilibrium.

EXAMINER: S. Portet

5. (6 points) Show that

$$x_{t+1} = \frac{ax_t}{b + x_t}, \quad a, b > 0$$

has no 2-cycle.

6. (15 points) Show that the two-dimensional system

$$\begin{aligned}x_{t+1} &= x_t(1 + x_t + y_t)/3 \\ y_{t+1} &= y_t(1 - x_t + y_t)/2\end{aligned}$$

has four fixed points, but only one that is locally stable.
